Growth of High-Tech Industries in China

- **As early as 2010, Chinese policymakers publicly declared their intent to upgrade from traditional manufacturing industries to an advanced technology-driven economy.**
 - The two primary sources of economic growth - labor force expansion and heavy capital investment – are fading away (Woetzel et al., 2015; Wei et al., 2017).
- **China has rapidly increased its research and development (R&D) intensity and is now on par with major developed economies.**
 - The number of patents filed by Chinese firms has increased four fold over the past decade.

Our Paper

香港中文大學(深圳)
The Chinese University of Hong Kong, Shenzhen

深圳高等金融研究院

- **There has been limited research on the efficacy of China's government policies on fostering innovation.**
 - Several papers have analyzed government policies on innovation in China, including government subsidies (Wei et al., 2017), high-tech zones (Tian and Xu, 2021), Innofund (Guo et al., 2016), and InnoCom (Chen et al., 2021b).
 - Much thinner research compared to a large literature on China's rapid growth in traditional industries (e.g., Brandt and Zhu, 2000; Li and Zhou, 2005; Song et al., 2011; Hsieh and Song, 2015; Xiong, 2018).
- **We examine a unique mechanism where the Chinese government employs high-tech incubators as market intermediaries to achieve its policy goals in high-tech industries.**
 - Unlike the conventional approach of direct subsidization, the government can utilize high-tech incubators as intermediaries to stimulate the growth of high-tech startups by directing its support through them.

High Tech Incubators

- **High-tech incubators identify and foster the growth of nascent startup companies in their early stages.**
 - Offer a range of services to startups, including office space, mentoring, professional services, technical support, and access to capital financing, to facilitate their growth until they are ready to “graduate”.
 - Generate revenue from service charges and, more importantly, equity investments in startups, and their success is contingent on their ability to select and foster high-potential incubatees.
 - Gonzalez-Uribe and Leatherbee (2018), Madaleno et al. (2018), Yu (2020), Hallen et al. (2020), Gonzalez-Uribe and Reyes (2021).

High Tech Incubators in China

- **China's high-tech incubators has witnessed rapid expansion in the past two decades.**
 - Over 5,000 incubators and more than 200,000 incubated startups in 2019.
 - Approximately 70% of high-tech incubators are privately owned, while the remaining 30% are state-owned.
 - The vast majority of incubated startups are privately owned.
 - High-tech incubators in China are registered and accredited by the government, and they receive subsidies from the government to support their operations.
 - For example, a district government in Shenzhen provides each high-tech incubator with a one-time subsidy of up to \$300,000 (RMB 2,000,000) and an annual performance-based bonus.

Research Design

香港中文大學(深圳)
The Chinese University of Hong Kong, Shenzhen

深圳高等金融研究院

- **We analyze the effectiveness of the incubator mechanism in China using a unique dataset of all high-tech incubators from 2015 to 2019.**
 - The dataset contains information on incubator and startup characteristics.
- **We leverage the variation in industrial policies that target different “strategic emerging industries” (SEIs) across different provinces.**
 - Industrial policies implemented under the 13th Five-Year Plan (FYP, 2016-2020), designed to support targeted SEIs.
 - The SEIs targeted by the policy vary significantly across provinces.
- **We use a DiD analysis to estimate the impact of the industrial policy on the government support received by incubators and the innovation of their startups.**
 - Compare the differential outcomes between the targeted and control industries and between the periods before and after the policy implementation.

Summary of Findings

- **High-tech incubators in the targeted industries, relative to those in the control industries, receive significantly more government support after the implementation of the industrial policy.**
 - Increase in all three forms of government support: cash subsidies, equity investment, and tax reduction.
 - In contrast, we find little change in non-government funding, such as funding from corporations, nonprofit organizations, or individuals.
- **Government support to incubators has a significant and positive effect on the innovation activity of incubated startups.**
 - To address endogeneity concerns, we conduct 2SLS regressions with two instrumental variables (IVs) for government support based on the predicted tenure of local politicians and local exposure to China's anti-corruption campaign.

香港中文大學(深圳)
The Chinese University of Hong Kong, Shenzhen

深圳高等金融研究院

Summary of Findings

- **Combining the first two findings, we conclude that the incubator-based mechanism significantly increases the innovation measures of startups following the policy implementation.**
 - We estimate that the incubator approach accounts for over one-seventh of the policy effects on the innovation activity of high-tech startups in targeted SEIs.
- **Treated state-owned incubators receive disproportionately more support from local governments than their treated private counterparts after the policy implementation.**
 - However, startups in treated state-owned incubators experience significantly lower growth in innovation activity following the policy than those in the treated private incubators.
 - Our finding that less efficient state-owned incubators receive more government subsidy post-policy than private incubators may indicate potential resource misallocation despite the market-based approach.

Data and Sample

- **We obtain data on all Chinese high-tech incubators from 2015 to 2019 from China's Ministry of Science and Technology (MOST).**
 - Constructed under China's "Torch Program", a national initiative aimed at promoting the development of high-tech industries.
 - The sample size grows rapidly over time, from 2,071 incubators and 120,000 startups in 2015 to 5,206 incubators and 270,000 startups in 2019.
 - Incubators: year of establishment, national incubator, location, industry, ownership (SOE), types of funding, revenue, operating costs, profit, employment, services, high-tech zone, etc.
 - Incubated startups: year of establishment, year of entering the incubator, founder information (repeated, background, gender, etc.), HTF, location, industry, VC funding, area, revenue, profit, export, R&D, tax, employment, patents, licenses, graduate, etc.

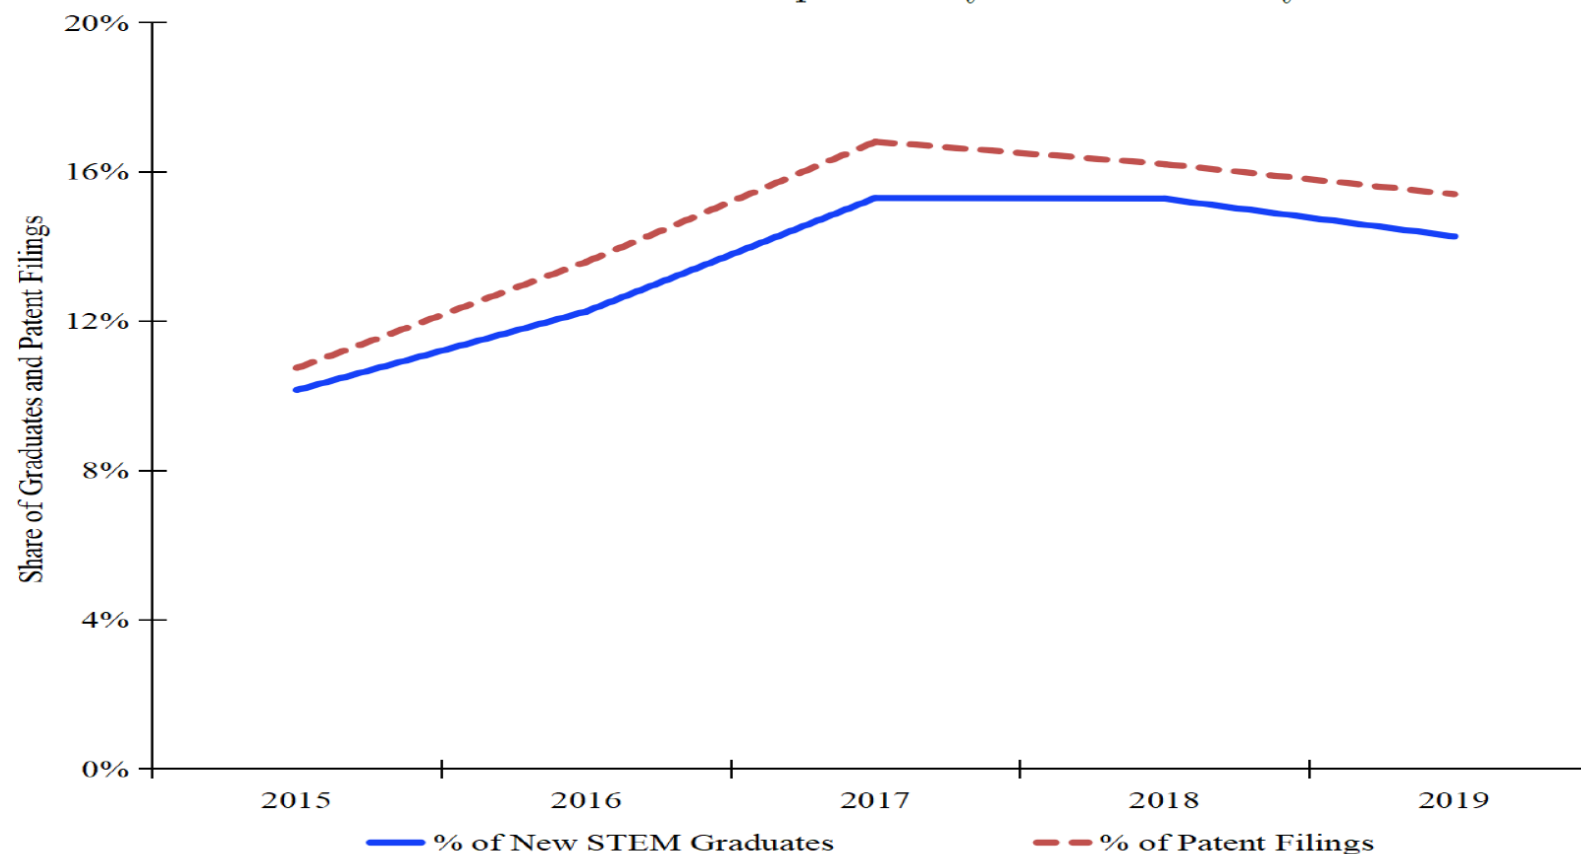

香港中文大學(深圳)

深圳高等金融研究院

Figure 2B: Startup Activity in the Economy

B: Share of Startup Activity in the Economy

- In 2019, these high-tech startups hire 260,000 new STEM graduates and file 270,000 patent applications.

Classifications of Policy-Targeted Industries

- **We identify the targeted industries in the province-level “13th Five-Year Plan” that were announced by provinces during 2016 and early 2017.**
 - These FYPs include “key development industries”, and the number varies from two to over a dozen across provinces.
 - We identify the first three “key development industries” as the policy-targeted industries in a province.
- **Sample for the difference-in-differences (DiD) analysis.**
 - Since our DiD analysis requires lagged data, this part of the sample starts from 2016.
 - We set 2016 as the pre-event period, and 2017-2019 as the post-event period.
 - Include only incubators and startups that exist in 2016.
 - Our final sample of incubators contains 8,322 incubator-year observations from 2016 to 2019, and the sample of startups contains 169,377 startup-year observations from 2016 to 2019.

2SLS Analysis

香港中文大學(深圳)
The Chinese University of Hong Kong, Shenzhen

深圳高等金融研究院

- **Omitted variables may drive both the government support received by incubators and incubated startups' performance.**
 - A well-managed incubator may also be good at obtaining government support.
- **The first IV is a dummy variable for the *predicted* first and second year of a city party-secretary's tenure, and zero otherwise.**
 - Ru (2018): New officials tend to increase public investment in their early years of tenure., which may lead to less government support to incubators due to policy interruption or a more passive policy.
 - This is likely to increase government support to high-tech incubators but unlikely to be directly related to startup's innovation activity.

2SLS Analysis

- **The second IV is a dummy variable for the first and second year when a city's party secretary or mayor is investigated for corruption during the anti-corruption campaign.**
 - Fang et al. (2022): The anti-corruption campaign can deter government officials from dealing with private firms.
 - It is also well documented that some government officials become more passive after the campaign to “play it safe”.
 - Local exposure to the anti-corruption campaign may decrease government support to high-tech incubators.

Evaluation of Incubator Channel

- **We estimate that the incubator channel increase startups' innovation activity in targeted SEIs after policy implementation by:**
 - 6.6% for startup R&D; 9.3% for startup employment
 - 8.3% for startup patent applications.
 - 3.0% for startup total revenue.
 - 97.0% for outside VC funding.
 - 2.3% for probability of “graduation”.
- **Overall, the incubator channel accounts for 13.6%, or over one-sixth of the policy benefits for the sample high-tech startups.**
 - We estimate the overall policy benefits for high-tech startups by running DiD regressions of startup innovation activities on $Treated \times Post$.
 - Caveat: Our data does not cover the high-tech startups that are not incubated.

Startup-Level Analyses

- **The results of the start-up level analyses are consistent with those of the incubator-level analyses.**
 - Startups that are not government-classified “high-tech” firms.
 - Non-SOE startups.
 - Young startups.
- **Cross-sectional analyses show larger policy benefits for the subsample of less resourceful start-ups**
 - Startups that are not government-classified “high-tech” firms.
 - Young startups.

Conclusions

- **High-tech incubators serve as important market-based intermediaries in carrying out government policies that foster innovation.**
 - Using the 13th FYP as a policy setting, we find that high-tech incubators in the targeted industries receive significantly more government support after the implementation of the policy.
 - Government support to incubators has a significant and positive effect on the innovation activity of incubated startups.
 - The incubator approach accounts for approximately one-seventh of the policy effects on the high-tech startups' innovation activity.
- **State-owned incubators, relative to privately owned incubators, receive more government support but are less efficient in promoting growth of startups.**
 - Potential resource misallocation despite the market-based approach.
